Dear Dr. Moon:

I am a scientist with the U.S. Environmental Protection Agency, and am working on a review of the immune-related effects of formaldehyde. I am writing to you regarding your 2009 paper "Indoor Volatile Organic Compounds in Atopy Patients' Houses in South Korea", published in 2009 in *Indoor and Built Environment* (copy attached).

My question specifically concerns the length of the formaldehyde exposure measurement period (e.g., 2 hours? 8 hours?), particularly for the indoor measurements. I'm sorry if I missed it, but I couldn't find this information in the methods section, or elsewhere in the paper.

Our review includes approximately 20 epidemiologic studies with data on formaldehyde exposure and allergic sensitization or asthma, and we would like to include this level of detail regarding the exposure assessment for each of them.

Thank you very much for your consideration of this email. I appreciate any assistance you can give me.

Sincerely,

Glinda Cooper
